

DESCRIPTION

5

BACKGROUND OF THE INVENTION

1. Field of the Invention -

The present invention relates to a barbeque or grilling fork, and more particularly pertains to a new grilling fork for lifting food on a plurality of tines and releasing said food from said tines with the use of only one hand as a trigger mechanism in the fork
10 handle is pulled.

2. Description of the Prior Art

The use of barbecuing or grilling is a well known and long standing favorite method of preparing food for consumption. The process of barbecuing involves various
15 tasks such as starting the fire, cleaning the grill, seasoning the food, and grasping and/or rearranging the food on the grill. A variety of tools have been developed to assist in these tasks.

The use of barbecue forks is known in the prior art. These tools are designed and utilized to allow the user to grasp and move food without having to touch the food with
20 any part of his or her body. Known prior art includes U.S. Pat. No. 6,536,118, U.S. Pat. No. 5,206,998, U.S. Pat. No. 4,844,525, U.S. Pat. No. 5,896,668, U.S. Pat. No. 3,162,475, U.S. Pat. No. 4,539,751, and U.S. Pat. No. 5,518,284.

Tools such as forks are designed to grasp and rearrange food allow a user to do so without having to touch the food with any part of his or her body. This lessens the danger
25 to the user of suffering a burn due to contact with the food, flame, or the hot grill or stove. The possibility of transferring infectious disease-causing organisms is also decreased as there is no contact between the user and the food.

While these utensils fulfill their relevant, specific objectives and requirements, the aforementioned patents do not disclose a new grilling fork. The standard grilling fork
30 allows the user to grasp and rearrange food with one hand. In many cases however, food grasped and rearranged by standard forks cannot be easily dislodged and/or removed

from the tines of said fork. This many times results in the user utilizing the fingers of his or her free hand to dislodge the food, negating the advantages of keeping the user's person from the hot food, flame and grill, and increasing the possibility of spreading infectious disease-causing organisms. A user will also frequently agitate or shake a fork
5 to dislodge the food from the tines of a conventional food, resulting in an uncontrolled release of the food which may fall onto a non-desirable area, such as, for example, into the flames or on the floor. Furthermore, if a second utensil is used in the other hand to dislodge food from the fork, this hand is encumbered and cannot be used to manipulate any other object, such as, for example, a plate of food or a shaker of salt.

10 Therefore, the grilling fork according to the present invention departs from the standard concepts and substantially improves food handling by allowing the user to dislodge food from the tines in a controlled manner using only one hand.

BRIEF DESCRIPTION OF THE DRAWINGS

15 A self clearing grilling fork embodying the features of the present invention is depicted in the accompanying drawings which form a portion of this disclosure and wherein:

Fig. 1 is side view of the self-cleaning grilling fork of this invention.

Fig. 2 is a top view of the self-cleaning grilling fork of Fig. 1.

20 Fig. 3 is enlarged view perspective view of the self-cleaning tines of the grilling fork of Fig. 1.

Fig. 4 is section view of the grilling fork of Fig. 1, along section line BB.

Fig. 5 is sectional view of the grilling fork of Fig. 2, along section line AA.

25 OBJECTS OF THE INVENTION

It is the principal object of the present invention to provide a fork for securing, handling, and releasing food that accomplishes these actions with the use of only one hand.

Another object of this invention is to provide a fork that allows food to be
30 released from the fork while keeping the users fingers and/or hands a safe distance from

the hot food, flame and grill/cooking device to prevent the user's fingers and/or hands from being burned.

Another object of this invention is to provide a fork that allows food to be released from the fork while keeping the users fingers and/or hands a safe distance from the food and grill/cooking device to prevent the transfer and/or spread of infectious disease-causing organisms

Another object of this invention is to provide a fork capable of securing, moving, and releasing food in a controlled manner.

Another object of this invention is to provide a fork with an easy to operate mechanism for releasing food.

Another object of this invention is to provide a fork having a plurality of tines and a food release plate used to push food off the tines.

Another object of this invention is to provide a fork having a trigger mechanism in the handle that controls the movement of an inner shaft inside a hollow outer shaft, said inner shaft controlling the movement of the food release plate along the tines.

Another object of this invention is to provide a fork made of simple construction, easy to use, easy to clean and maintain, and inexpensive to manufacture, solving the problems and satisfies the needs existing in the art.

DETAILED DESCRIPTION

Before explaining at least one embodiment of the invention in detail, it is to be understood that the invention is not limited in its application to the details of construction and to the arrangements of the components set forth in the following description or illustrated in the drawings. The invention is capable of other embodiments and of being practiced and carried out in various ways. Also, it is to be understood that the phraseology and terminology employed herein are for the purpose of description and should not be regarded as limiting.

These and other objects of the present invention are accomplished through the use of a fork (10) having a plurality of stainless steel tines (12) with a food release plate (14) positioned on and straddling the proximal end of said tines, said food release plate possessing a plurality of openings through which the tines of the fork project. The tines of

the fork are connected to the distal end (15) of a longitudinal hollow shaft (16) by way of a form fitted sleeve (18) of hardened plastic, while the proximal end (20) of the hollow shaft (16) is connected to an ergonomically shaped, textured handle of hardened plastic (22).

5 Within the hollow outer shaft (16) resides a longitudinal inner shaft (24) of lesser circumference. The distal end (26) of this inner shaft (24) is connected to the food release plate (14) at a point midway between the plurality of openings, while the proximal end of the inner shaft (24) extends into the handle (18) and is connected to a trigger assembly (28).

10 The handle (18) contains a trigger assembly (28) inside that extends through the bottom of said handle. The user pulls the trigger (30), which in turn moves the connected inner shaft (24) forward inside the hollow outer shaft (16), thus causing the food removal plate (14) to slide forward along the length of the tines (12), removing any food (32) that may be secured to said tines.

15 The present invention has been designed to be used with one hand, eliminating the necessity of removing food from the tines of the fork by means of the user's fingers, hands, or another utensil or tool, and allowing one of the user's hands to remain free. This fork provides the user a tool to secure, handle, and release food in a safe and controlled manner at the convenience of the user.
